The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpseviridae, retroviridae) haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allexyy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                        Treating non-allergic inflammatory diseases, such as psoriasis, eczallergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ds; allergy; asthma; poly-G nucleic acid; aerosol formulation; hypo-responsive subject; immunostimulatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesfon, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, observable syndrome, mocatagial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atheroscierosis, scleroderma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
rubeosis; Osler-Webber Syndrome; myocardial angiogenesis;
plaque neovascularisation; telangiectasia; haemophiliac joint;
angiofibroma; wound granulation; intestinal adhesion; atherosclerosis;
scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.
The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes a process for circularizing an oligonucleotide around a double-stranded nucleic acid that contains a target sequence. The method is used to detect or label nucleic acids, particularly plasmids, to detect target sequences in the nucleic acids, and to distinguish between two sequences that differ in only 1 or 2 mutations. It can be used to select, e.g. from degenerate single-stranded nucleic acids, sequences that can bind to the nucleic acid, particularly sequences that promote entry of the nucleic acid into cells or can target the nucleic acid to specific cellular compartments. The method can also be used to purify nucleic acids, particularly plasmids, and in gene therapy for specific inhibition of a gene contained in the nucleic acid. ABLS6735-36 represent a fragment of the murine androgen receptor promoter. They were used in the course of the invention, during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Circularizing oligonucleotide around double-stranded nucleic acid, useful e.g. for detecting mutations, using target-binding oligonucleotide with complementary end sequences.
                                                                                                                                                                                                                                                                                              Nucleic acid detection; nucleic acid labelling; gene therapy;

                                                                                                                                                                                                                                                                                                                                       ....uarizing oligonucleotide around double-stranded nucleic acid, useful
e.g. for detecting mutations, using target-binding oligonucleotide with
complementary end sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a process for circularizing an oligonuclectide around a double-stranded nucleic acid that contains a target sequence. The method is used to detect or label nucleic acids, particularly plasmids, to detect target sequences in the nucleic acids, and to distinguish between two sequences that differ in only 1 or 2 mutations. It can be used to select, e.g. from degenerate single-stranded nucleic acids, sequences that can bind to the nucleic acid, particularly sequences that promote entry of the nucleic acid into cells or can target the nucleic acid to specific cellular compartments. The method can also be used to purify nucleic acids, particularly plasmids, and in gene therapy for specific inhibition of a gene contained in the nucleic acid. ABLS6735-36 represent a fragment of the murine androgen receptor promoter. They were used in the course of the invention, during

The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide sequences AAA36632 and peptide sequences AAA3663-A36652 and peptide sequences AAA36650 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver transporter system is used in gene therapy, particularly to deliver nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g for treating cardiovascular disease, cancer, and infection. The transporter systems are also used to create transgenic animals (as models for human carcinogenesis or disease or for drug testing). Other uses include transforming cells to produce proteins, or transfecting cells in vitro to study the function of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from
                                                                                                                                                                                                                                                                            System for transporting nucleic acid into cells, useful e.g. in gene therapy and for generating transgenic animals, comprises binding agent linked to nucleic acid, surface ligand and lytic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transporter system; nucleic acid delivery; gene therapy; cancer; carcinogenesis; cardiovascular disease; infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        endosomes, without requiring endosomal or lysosomal degradation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ð
                                                                                                                                                                                    The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide sequences AAA36633-A36652 and peptide sequences AAY98456-Y98500 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g for treating cardiovascular disease, cancer, and infection. The transporter systems are also used to create transport sesting). Other uses include carcinogenesis or disease or for drug testing). Other uses include transforming cells to produce proteins, or transfecting cells in vitro carcinogenesis on of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from endosomes, without requiring endosomal or lysosomal degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                   System for transporting nucleic acid into cells, useful e.g. in gene therapy and for generating transgenic animals, comprises binding agent linked to nucleic acid, surface ligand and lytic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a nucleic acid transport system (NTS) for delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognizes and binds to a cell surface receptor or antigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through a nuclear membrane; and/or (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytoplasm of the cell. The NTS cellivers nucleic acid into the cellular interior as well as the nucleus of specific cells. The NTS can be used to treat disorders by targeting specific nucleic acid accordingly. The NTS can also be used to create transgenic animals for assessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells. The NTS can be used in vitro with tissue culture cells. The yes agent within the NTS avoids the problem of endosomal/lysosomal
                                                                                                                                                                                                                                                                                                          Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid transport system; NTS; cell surface receptor; cytosis; nuclear membrane; lysis molety; transgenic animal; human disease; nucleic acid delivery; cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                            The invention relates to a nucleic acid transport system (NTS) for delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognizes and binds to a cell surface receptor or artigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through a nuclear membrane; and or (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytolasm of the cell. The NTS delivers nucleic acid into the cellular interior as well as the nucleus of specific cells. The NTS can be used to treat disorders by targeting transgenic animals for assessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells animal model. The NTS can be used in vitro with tissue culture cells which allows the role of various nucleic acids to be studied by targeting specific expression into specifically targeted tissue culture cells. The last agent within the NTS avoids the problem of endosomal/lysosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                           Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid delivery; nucleic acid transporter system; hormone; enzyme; growth factor; clotting factor; apolipoprotein; receptor; drug; oncogene; tumor antigen; tumor suppressor; viral antigen; parasitic antigen; bacterial antigen; parasitic antigen;

Nucleic acid transporter system for delivering nucleic acid into a cell, useful for delivering proteins and polypeptides to cells, including

```
This invention describes a novel system (1) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a curface ligand, and a second binding complex comprising a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, apolipoproteins, receptors, drugs, oncogenes, tumor antigens, tumor appropriate system uses lysis agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid delivery; nucleic acid transporter system; hormone; enzyme; growth factor; olotting factor; apolipoprotein; receptor; drug; oncogene; tumor autigen; tumor suppressor; viral antigen; parasitic antigen; bacterial antigen; primer; ss.

```

This invention describes a novel system (I) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a nucleic acid and covalently linked to a nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic acid and covalently linked to nuclear ligand. The complexes are simultaneously bound to the nucleic acid. The nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, apolipoproteins, receptors, drugs, oncogenes, tumor antigens, tumor cauptoproteins, receptors, drugs, oncogenes, tumor antigens, tumor the transporter system uses lysts agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems

```
The sequence represents the pyrimidine-rich oligonucleotide #5 used in a nucleic acid transporter system. The nucleic acid transporter system uses mucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model.
                                                         Pyrimidine-rich oligonucleotide #5 used in nucleic acid transport system.

The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules, lysis agents and spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model.

The invention relates to a tumour necrosis-factor TNP inducible promoters.

The invention is useful for identifying candidate TNP inducible promoters by aligning a test sequence consisting of a nucleic acid sequence with a comparison sequence selected from the invention, using a gap opening penalty of 50 and a gap extension penalty of 3 to define a test alignment, shuffling the nucleic sequence of the test sequence at least one hundred times, while maintaining its length and composition, to produce a series of randomised sequences, aligning the randomised and appearance of 3, to produce a series of randomised calignments, where the average alignment quality of the randomised alignments represent an alignment quality of the randomised alignments represent an alignment expected by chance, comparing the test alignment with the average alignment quality of the randomised and identifying a test alignment with a probability value of less than to 0.05 that the alignment is obtained by chance as a candidate TNF inducible promoter. The invention is useful for identifying candidate compounds for treating or preventing autoimmune disorders or cancer. The present sequence is a primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel tumor necrosis-factor inducible promoter useful for identifying candidate compounds for treating/preventing autoimmune disorders/cancer, or for identifying promoters that are regulated by tumor necrosis factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences of human DNA polymerase pol kappa 76. The gene is found on human chromosome 5q12-13, in a head-to-head arrangement with the Goodpasture antigen binding protein (GPBP). The detection of the coding sequence can be used for diagnosing an autoimmune condition and identifying cells undergoing applytosis, and the sequences can be used in the treatment of autoimmune diseases and cancer. The present sequence is a sequencing primer
                                                                                                                                                                                                                                                                                                 Novel isolated pol kappa76 polypeptide, a 76 kDa alternatively spliced variant of DNA polymerase kappa, useful as target for treating a patient with autoimmune disorder or cancer.

The invention relates to an isolated pol kappa (k) 76 polypeptide (an alternatively spliced form of DNA polymerase kappa), appearing as ADD13492). The gene for AB007327 (encoded by the CDNA appearing as ADD13492). The gene for POLkappa is located on chromosome 5q12-13 in a head-head arrangement with the gene encoding Goodpasture antigen binding protein (GDBP or collagen 4 alpha 3 binding protein (CDL4A3bp), associated with autoimmune diseases cuch as Goodpasture's disease and cutaneous lupus) i.e. has a bi-comprising the polK76 cDNA, a host cell transfected with the vector, detecting (M1) polK76 (comprising providing a protein sample to be corrected, contacting the protein sample to be screened, complexes, where the presence of the antibody-polypeptide complexes in a sample (comprising contacting the sample with one or more polK76 pcrimer, carrying out PCR to generate PCR products, and identifying the comprising providing a tissue of body fluid sample from the patient, comprising providing a tissue or body fluid sample in which no autoimmune condition is present, and detecting an increase in pol K76 RNA expression in the tissue of body fluid sample compared to the control sample, where the increase indicates the presence of an autoimmune condition) and the tissue of body fluid sample compared to the control sample, where the increase indicates the presence of an autoimmune disorder or cancer by modifying the expression or activity of polK76 or polK76 increasing their expression or activity of polK76 increasing produce is a PCR and/or sequencing primer used in the analysis of bi-directional promoters of encer in the present sequence is a PCR and/or sequencing cancer. The present sequence is a PCR and/or sequencing in the present sequence is a PCR and/or sequencing in the present sequence is a PCR and/or sequence is a PCR and/or seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; tumour necrosis factor inducible promoter; TNF; autoimmune disorder; cancer; PCR; immunosuppressive; cytostatic; ss;

The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nuclectide sequences AAP36633-A3662 and peptide sequences AAP36456-Y98500 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver transporter systems are also used to create transporter and infection. The transporter systems are also used to create transport and infection. The transporter systems are also used to create transport and infection. The transporter cransforming cells to produce proteins, or transfecting cells in vitro transforming cells to produce proteins, or transfecting cells in vitro to study the function of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from condosomes, without requiring endosomal or lysosomal degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model.
System for transporting nucleic acid into cells, useful e.g. in gene therapy and for generating transgenic animals, comprises binding agent linked to nucleic acid, surface ligand and lytic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a nucleic acid transport system (NTS) for

                                                                                                                                                                                                                                                                                                                                                                                                                                                  promoter. Also disclosed are an expression vector comprising one or more trumour necrosis factor inducible promoters and a recombinant host cell transfected with one or more expression vectors. The TNF inducible promoters, expression vectors and host cells are useful for identifying promoters that are regulated by tumour necrosis factor or for identifying promoters that compounds for treating or preventing autoimmune disorders or candidate compounds for treating or preventing autoimmune disorders or necrosis factor inducible promoter of the invention.

delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognizes and binds to a cell surface receptor or acting or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through a nuclear membrane; and/or (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytoplasm of the cell. The NTS delivers nucleic acid into the cellular interior as well as the nucleus of specific cells. The NTS can be used to treat disorders by targeting specific nucleic acid acordingly. The NTS can also be used to create transgenic animals for assessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells. Which allows the role of various nucleic acids to be studied by targeting specific expression into specifically targeted tissue culture cells. The last agent within the NTS avoids the problem of endosomal/lysosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel system (1) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid delivery; nucleic acid transporter system; hormone; enzyme; growth factor; clotting factor; apolipoprotein; receptor; drug; oncogene; tumor antigen; tumor suppressor; viral antigen; parasitic antigen; bacterial antigen; primer; ses

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence represents the double-stranded vector target sequence #5 used in a nucleic acid transporter system. The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules, lysis agents and spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into hepatocytes, muscle cells e.g. in gene therapy to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells
nuclear ligand. The complexes are simultaneously bound to the nucleic acid. The nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, apolipoproteins, receptors, drugs, oncogenes, tumor antigens, tumor suppressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid transport, cytosis; ligand; lysis agent; spacer molecule; gene therapy; hepatocyte; muscle; bone forming cell; ds.

artiple-helix computation triangle helical nucleic acid computation triangle and second substantially complementary strands, and an oligonuclectide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonuclectide binds in a parallel and antiparallel orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonuclectides can be used to form triple-helices, and are useful to cletcet the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonuclectides can be selected to specifically bind to pathogenic double-stranded DNA including selected to specifically bind to pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the oligonuclectides can be chosen to target a unique sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present invention relates to methods and oligonucleotides for forming
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   parnogen which is not found in the genome of pathogen's host. The suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancer tries of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancernal origin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents a DNA sequence used in the methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonuclectide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression.
                                                                                                                                                                                                                                                                                                                                                                        Triple-helix formation; purine-rich target sequence; double-helix DNA; gene expression; regulatory sequence; pathogenic double-stranded DNA; pathogenic bacteria; virus; replication; virulence; cancer; cancer oncogene suppression; cancervus cell; cytostatic; antimicrobial; ss.

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel acid, where the oligonucleotide binds in a parallel and antiparallel configuration, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the oligonucleotide are chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents a DNA sequence used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression.
                                                                                                                                                                                                                                                                                                                                                                        Triple-helix formation; purine-rich target sequence; double-helix DNA; gene expression; regulatory sequence; pathogenic double-stranded DNA; pathogenic bacteria; virus; replication; virulence; cancer; oncogene suppression; cancerous cell; cytostatic; antimicrobial; ss.

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel crientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic application, where gene expression is controlled by selective triple-helix formation oligonucleotides can be used to form triple-helics, and are useful to eligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA cor diagnostic and therapeutic purposes. The oligonucleotides can be selected to specific sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the propertion of the oligonucleotide can be chosen to target a unique sequence of the propertion of the oligonucleotide can be chosen to target a unique sequence of the propertion of the oligonucleotide can be chosen to target a unique sequence. The oligonucleotides can be used in cancer treatment by way of triple helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the the present invention methods of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Wbeta gene, WbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease. Autoimmune diseases include Addison's diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, arcphic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclerosis and Li hypersensitivities such as contact with allergens that lead to Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

Oligonucleotides conforming to this sequence were 5' end radioactively labeled using T4 polynucleotide kinase and gamma 32P ATP. The annealed oligomers form a purine-rich trarget sequence to which an oligonucleotide (TFO) containing a nebularine nucleotide binds, forming a triple helix. These triplex-forming oligomers may be used to detect the presence or absence of specific sequences within genomic DNA by the formation in situ or in vivo of triple helices for diagnostic and therapeutic purposes. TFO can be selected which specifically bind to pathogenic double-stranded DNA including specific sequences required by Alternatively, TFO can be chosen to target a unique sequence of the pathogen which is not found in the genome of the host. It may include a
caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
                                                                                                                                      such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Voeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Duplex, T4 polynucleotide kinase, nebularine, triple helix; triplex,

                                                                                                                                                                                                               The sequences given in AAQ46256-57 form a duplex which was used to evaluate the binding of trplix forming oligomers (TFO). The annealed coligomers form a purine-rich target sequence to which the TFO which contain a nebularine nucleotide binds, bind, forming a triple helix. These triplex-forming oligomers may be used to detect the presence or specific sequences within genomic DNA by the formation in situ or in vivo of triple helices for diagnostic and therapeutic purposes. TFO can be selected which specifically bind to pathogenic double-stranded DNA or in vivo of triple helices for diagnostic and therapeutic purposes. TFO can be selected which specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses including specific sequence. Alternatively, TFO can be chosen to target a unique sequence of the pathogen which is not found in the genome of the pathogen which is not found in the genome of the pathogen witch is not found in the call containing it. Triple helix technology can also be used for cancer treatment by way of triple helix suppression of specific oncogenes including those of endogenous or viral origin. (Updated on 25-MAR-2003 to
                                                                                                                      ;

The annealed coligomers form a purine-rich target sequence to which the TFO which contain a nebularine nucleotide binds, bind, forming a triple helix. These triplex-forming oligomers may be used to detect the presence or absence of specific sequences within genomic DNA by the formation in situ or in vivo of triple helices for diagnostic and therapeutic purposes. TFO can be selected which specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence. Alternatively, TFO can be chosen to target a unique sequence of the pathogen which is not found in the genome of the host. It may include a therapeutic agent to kill the pathogen or the cell containing it. Triple helix technology can also be used for cancer

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel or respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA collected to specifically bind to pathogenic double-stranded DNA selection sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen; The pathogen which is not found in the genome of pathogen; The
                                                                                                                                                                                                         ö
treatment by way of triple helix suppression of specific oncogenes including those of endogenous or viral origin. (Updated on 25-WAR-2003 correct PN field.)

pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix

```
The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel or riempartively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the the pathogen which is not found in the genome of pathogen's host. The
                                                                                                                                                                                                                         ö
               origin. Such therapeutic oligonucleotides are capable of forming triple-
helices with such sequences in cancerous cells containing the activated
oncogene, so preferentially killing or repressing the cancer causing
cell. The present sequence represents a DNA sequence used in the methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to

The present invention relates to methods and oligonuclectides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonuclectide bund to a purine-rich target sequence within the double helical nucleic acid, where the oligonuclectide binds in a parallel and antiparallel corientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonuclectides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonuclectides can be seed to granding their pathogenic double-stranded DNA including selected to specifically bind to pathogenic double-stranded DNA including replication or virulence, reducing their pathogenicity. Alternatively, the oligonuclectide can be chosen to target a unique sequence of the
                                                                                                                                                                                                                                                                           ö
oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents a DNA sequence used in the methods of the present invention

a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel or acid, where the oligonucleotide binds in a parallel and antiparallel or crientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, which expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA controlled by a controlled by a controlled by a controlled by a controlled by pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively,
                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to methods and oligonucleotides for forming
                                                              origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents a DNA sequence used in the methods
pathogen which is not found in the genome of pathogen's host. The digonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Triple-helix formation; purine-rich target sequence; double-helix DNA; gene expression; regulatory sequence; pathogenic double-stranded DNA; pathogenic bacteria; virus; replication; virulence; cancer; oncogene suppression; cancerous cell; cytostatic; antimicrobial; ss.

ö
the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Triple-helix formation; purine-rich target sequence; double-helix DNA, gene expression; regulatory sequence; pathogenic double-stranded DNA; pathogenic bacteria; viewis; replication; virulence; cancer; oncogene suppression; cancerous cell; cytostatic; antimicrobial; ss.

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical mucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for

The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so industrial importance can be obtained. Specifically, sequences which are industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a kit for the immunodetection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus in a sample. S.aureus in a sample, sequencial infections, food poisoning, osteomyelitis, skin and surgical wound infections, scaled skin syndrome, toxic shock
replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents a DNA sequence used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Computer readable medium; vaccine; S.aureus infection; immunodetection; cellulitis; eyelid infection; food poisoning; osteomyelitis; therapy; skin infection; surgical wound infection; scalded skin syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  syndrome, etc. Organisms transformed with the DNA sequences can be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes enzymatic nuclear acts morecutes with many clearing activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17621 to AAA17622 represent ribozyme sequences for ARNT, and AAA1168 to AAA17662 represent ribozyme sequences for ARA1766 and AAA11885 and AAA1888 and AAA1988 (Corresponding target sequences; AAA17685 to AAA18838 and AAA1988 and AAA19185 to AAA19622 represent their corresponding target sequences for Tie-2, and AAA1888 to AAA1988 and AAA21861 to AAA21801 to AAA21802 represent ribozyme sequences; cequences for integrin alpha 6 subunit, and AAA2362 to AAA21500 and AAA21889 to AAA22475 and AAA2343 represent ribozyme sequence for integrin subunit beta 3, and AAA23476 to AAA23343 to AAA2342 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or
                                                                                                                                                                                                                                                                                             ö
                           (and their fragments) are useful as primers or probes for isolating homologues of any of the S aureus DNA sequences contained on the computer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ribozymes for modulating the synthesis, expression and/or stability mRNA encoding an angiogenic factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present invention describes enzymatic nucleic acid molecules with RNA

                                                    atrophic gastritis. Degenerative nervous system diseases include multiple soletosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by the yeast genus Candda, parasitic infections such as those caused by the yeast genus Candda, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
              including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease,

o,
                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oligonuclectides AAX40733-815 represent cloned and sequenced isolates from pooled generations used for screening DNA cytosine methyltransferase (DrWrase) binding discrimination. The oligonucleotides are double stranded, and the guanine containing strand is shown. The specification describes a synthetic oligonucleotide comprising a C-5 methylcytosine which recognizes and binds an allosteric site on DCMTase, thereby modulating DCWTase activity associated with the allosteric site. The synthetic inhibitor can be used to inhibit methylation of DNA. It can also be used to inhibit proliferation of cancer cells. The inhibitor can also be used to treat a disorder of development, which is linked to a genetic locus regulated by methylation, such as Huttingcon's disease,
soluble organic solvent at a suitable concentration gradient to elute the deprotected oligonucleotides; and (e) removal of the solvent and the salt from the eluted oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA cytosine methyltransferase modulator containing 5-C methylcytosine used to inhibit methylation of DNA, and proliferation of cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                          DNA cytosine methyltransferase; DCMTase; binding discrimination; C-5 methylcytosine; allosteric site; synthetic inhibitor; cancer cell; proliferation; development disorder; Huntington's disease;

The present sequence is an oligonucleotide provided in a specification relating to the simplified purification of oligonucleotides by liquid chromatography. The process comprises: (a) pouring oligonucleotides protected with a hydrophobic group and oligonucleotide with no protective group into a liquid chromatography column packed with an acid and alkali resistant packing agent, such as polystyrene resin; (b) pouring a mixed developing solvent composed of a buffer made from a volatile salt and a water soluble organic solvent at a suitable concentration gradient into the column; (c) pouring an acid, particularly 6-16 v/v* acetic acid, into the column to deprotect the oligonucleotides protected with the hydrophobic group; (d) pouring a mixed developing solvent composed of a buffer made from a volatile salt, particularly 0.05-0.5 N aqueous ammonium hydrogencarbonate solution adjusted at pH 8-10, and a water

process for purification of oligonucleotides using liquid

the invention relates to novel nucleic acid molecules constituting the human gamma-amino butyric acid (GABA)B receptor 1 promoters Pla and/or human gamma-amino butyric acid (GABA)B receptor 1 promoters Pla and/or corms or active fragments. PCR primers AAF28788-AAF28805 were used for corms or active fragments. PCR primers AAF28788-AAF28805 were used for CFR mutagenesis of the GABA(b) promoter sequences for mutational analysis of promoter element function. Nucleic acid molecules containing the human GABAB receptor 1 promoters pla and/or plb are useful for screening therapeutic agents that selectively regulate the expression of GABAB receptor la- and lb-type splice isoforms. These compounds, which are condulators of GABAB receptor 1 transcription, are potentially useful in the treatment of disorders that are related to neurally-controlled physiological responses regulated by GABAB receptors such as central nervous system (CNS) disorders, e.g. muscle relaxation in spinal spatinity, Alzheimer's disease and other dementias, psychiatric and neurological disorders, asthum, gut motility disorders, e.g. irritable cardiovascular disorders, asthum, gut motility disorders, e.g. irritable

The invention relates to novel nucleic acid molecules constituting the human gamma-amino butyric acid (GABA)B receptor 1 promoters Pla and/or bub (AAP28781 and AAF28782). Or their functionally equivalent modified forms or active fragments. PCR primers AAF2878865 were used for forms or active fragments. PCR primers AAF2878865 were used for CC FCR mutagenesis of the GABA(b) promoter sequences for mutational analysis of promoter element function. Nucleic acid molecules containing the human CC GABAB receptor 1 promoters pla and/or Plb are useful for screening therapeutic agents that selectively regulate the expression of GABAB receptor la- and 1b-type splice isoforms. These compounds, which are modulators of GABAB receptor 1 transcription, are potentially useful in the treatment of disorders that are related to neurally-controlled physiological responses regulated by GABAB receptors such as central nervous system (CNS) disorders, e.g. muscle relaxation in spinal nervous system (CNS) disorders, e.g. muscle relaxation in spinal courties, all disorders, e.g. depression, anxiety or epilepsy, cardiovascular disorders, asthma, gut motility disorders, e.g. irritable bowel syndrome, emesis or reflux disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apolymorase, related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins, cytochromes, kinesins, cytokines, interferons, interleukins, Grotein coupled receptors and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The present invention relates to oligomucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, appprosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins coupled receptors and thloesterases. The present sequence is one such oligomucleotide. The oligomucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's diseases), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, concerning the protein of pathogenic concerning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   XXXXXXXXX
```

```
The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apptoais related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins coupled receptors and thioseterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, clastemic lupus erythromatosus and Gravé a disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apptoais related proteins, oadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins coupled receptors and thioseferases. The present sequence is one cuch oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune consistency of the may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, concerned the contraction of pathogenic contractions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present interaction describes enzymatic nuclear data morecules with knapper cleaving activity, which specifically cleave RNA encoded by an arth KNA decarbon nuclear transporter (ARNT) gene, an integrin alpha 6 subunit gene, an integrin subunit beta 3 cene, an integrin alpha 6 subunit gene, or a flate-2 gene. AAA1761 to AAA1762 to Peresent ribozyme sequences for ARNT, and AAA17169 to AAA17560 and AAA17623 to AAA17684 represent their corresponding target sequences; AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19087 to AAA19155 to AAA19152 represent their corresponding target sequences; and AAA19155 to AAA19150 to AAA19155 to AAA19150 to AAA1950 to AAA21960 and AAA1595 to AAA21961 and AAA21501 to AAA2159 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21360 and AAA21896 to AAA21896 to AAA21891 represent ribozyme sequences for integrin subunit beta 3, and AAA23342 represent ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha 6, or Tie-2. They are specially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARND), inflammation, and arthritis, as well as angiofibroma of tuberosis, pot-wine starins, surreas vulgaris, and angiofibroma of tuberosis, pot-wine starins, survey weber
                                                                                                                                                                                                                                                                                                                                                                                                                     Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           present invention describes enzymatic nucleic acid molecules with RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2,

CC dequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates conceding enzymes associated with drug metabolism. The invention relates conceptoding and compositions for identifying individuals who have at least one polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and pCR-based methods. The invention also encompasses methods of arrays and excenting drugs using genetic polymorphism data. Genetic polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genet that cause or exacerbate certain diseases. SNPs are particularly useful crugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of drug therapeutic effect for a particular patient. Dut would also reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and equate the invention are also useful in the drug discovery and conjunce the likelihood of adverse reactions, thereby individuals could be selected for clinical trials only if their generic profiles indicate that they are capable of responding to a particular drug or drug class, and previously falled drug candidates could be selected for clinical trials only if their generic profiles indicate that they are capable of responding to a particular drug or a drug c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy

Human catechol-O-methyltransferase COMT gene polymorphic site, #1181.

(first entry)

26-JUN-2003

ö

```
Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                             clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphism may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ60887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphism s(SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to chuge sNNBs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur continue as repeating sequences. The detection and analysis of polymorphisms cuch as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of drug therapeutic effect for a particular patient. But would also reduce the likelihood of adverse reactions, thereby increasing safety.

Methods of the invention are also useful in the drug discovery and approval processes. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of possible drug targets and decreases in the number of adverse drug reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy

TITLE

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwalvel [4] 4732114[gb] AF129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XIIO-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       26 bp DNA linear GSS 04-OCT-200
